

INTRODUCTION TO PYTHON

LECTURE 6: Data visualization

Asem Elshimi

asem.elshimi@austin.utexas.edu

Working with a sequence of numbers

```
xsequence=np.linspace(0,1,100)
y=np.cos(xsequence*2*np.pi)

fig=plt.figure()
ax=fig.add_subplot(1,1,1)
ax.plot(y)
ax.set_title('$y=\cos(2 \pi x)$')
plt.show()
```

Data visualization

OBAMACARE ENROLLMENT

What is wrong with this graph?

COURTESY OF FOX NEWS

Communicating results with scientific graphs.

Do you need a graph?

- Maybe a table is sufficient

What types of variables do you have?

- Continuous, discrete, categorical.
- Independent and dependent variables.

What is your message?

Basic rules:

- Check the data.
- Explain encodings
- Label axes
- Include units
- Include your resources

Basic rules for graphs

Can be interpreted in black and white

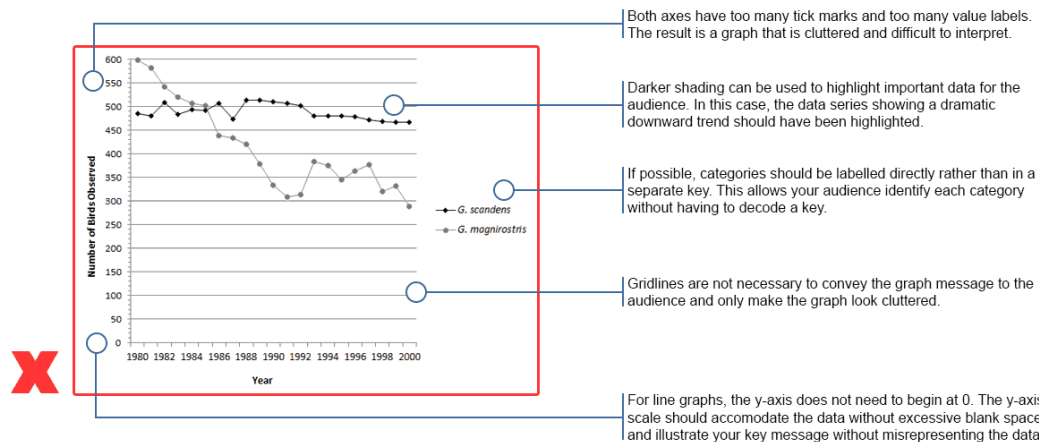

Title:

- **Descriptive:** Figure 1. Effects of dam construction on fish biodiversity.
- **Assertive:** Figure 1. Dam construction results in loss of fish biodiversity.

Line graph

Identifying trends over time | Comparing categories over time

Line graph syntax in python

```
x=np.arange(1,10,0.1)
```

```
##plotting
```

```
plt.close("all")
```

```
fig = plt.figure(figsize=(6,6), dpi=100)
```

```
ax=fig.add_subplot(111)
```

```
ax.plot(x, x**2, label="y = x**2")
```

```
ax.plot(x, x**3, label="y = x**3")
```

```
ax.legend(loc=2); # upper left corner
```

Minimal syntax

Too many spines.

Too many numbers.

Isolated legend.

- Black and white.

Data points missing

Missing labels

Scientific notation

```
x=np.arange(2,8,0.5)

##plotting
plt.close("all")
fig = plt.figure(figsize=(7,6), dpi=100)
ax=fig.add_subplot(111)

ax.plot(x, x**2, 'r--o')
ax.plot(x, x**3, 'b-.o')

#labels
ax.set_xlabel('x-values')
ax.set_ylabel('y-values')
ax.set_title('Graph template')

#limits
#ax.set_ylim(bottom=0)
#ax.set_xlim(left=0)
```

...

```
#ticks
```

```
ax.set_xticks(np.arange(min(x), max(x)+1, 2))
```

```
#annotations
```

```
ax.text(6, 6**2+20, r"$y=x^2$", fontsize=20, color="red")
```

```
ax.text(7-1, 7**3, r"$y=x^3$", fontsize=20, color="blue")
```

```
# Hide the right and top spines
```

```
#ax.spines['right'].set_visible(False)
```

```
#ax.spines['top'].set_visible(False)
```

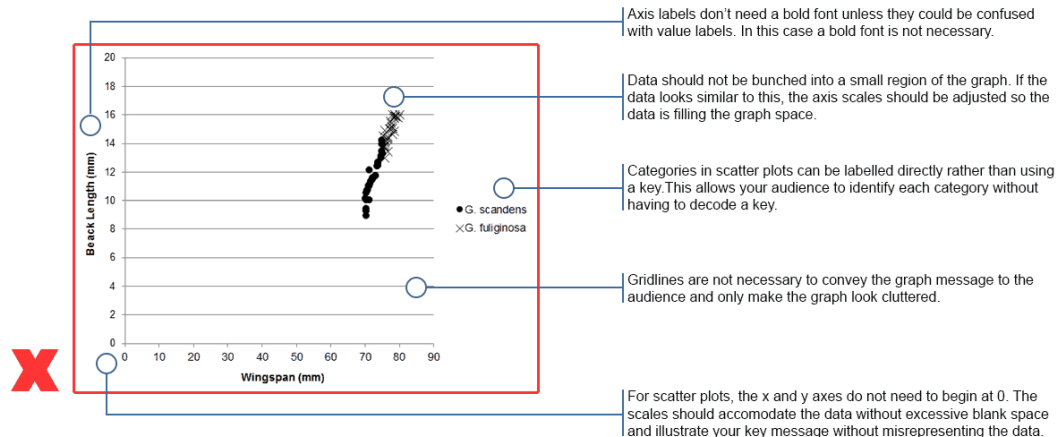

```
#make sure labels dont overlap
```

```
plt.tight_layout()
```

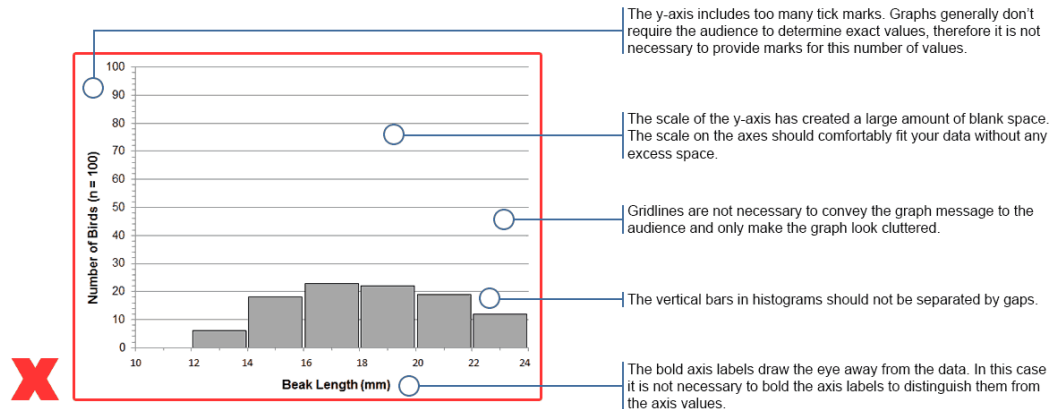

Scatter plot

Identifying relationships between variables | Displaying trends and correlations

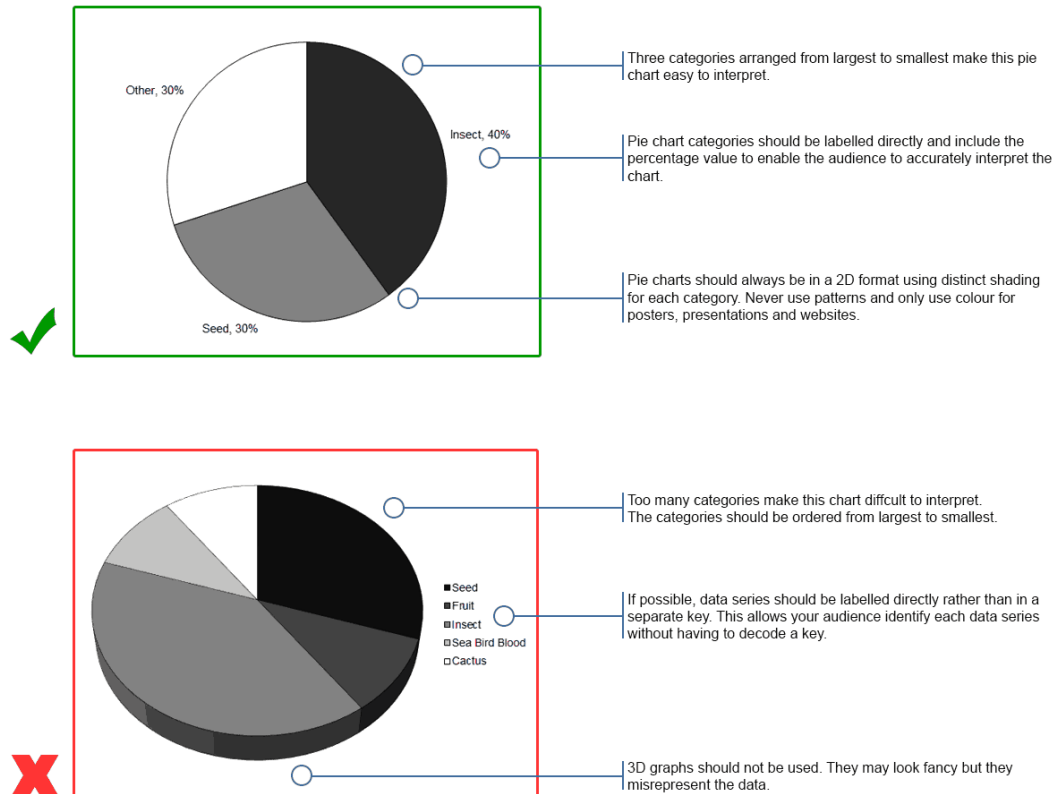

Histogram

Displaying distribution of continuous data | Useful for large data sets

Pie Chart

Comparing categorical data | Limited use for more than 4 categories

2 slices

Not bad.

4 slices

Still bearable.

8 slices

Um.

16 slices

Wait.

32 slices

Stop it.

64 slices

Now you've done it.

That's right.

That's not right.

Chart Suggestions—A Thought-Starter

How to speak MPL

Colornames:

- b: blue
- g: green
- r: red
- c: cyan
- m: magenta
- y: yellow
- k: black
- w: white

Full list: https://www.w3schools.com/Colors/colors_names.asp

Markers

marker	description	marker	description	marker	description	marker	description
"."	point	"+"	plus	","	pixel	"x"	cross
"o"	circle	"D"	diamond	"d"	thin_diamond		
"8"	octagon	"s"	square	"p"	pentagon	"*"	star
" "	vertical line	"_"	horizontal line	"h"	hexagon1	"H"	hexagon2
0	tickleft	4	caretleft	"<"	triangle_left	"3"	tri_left
1	tickright	5	caretright	">"	triangle_right	"4"	tri_right
2	tickup	6	caretup	"^"	triangle_up	"2"	tri_up
3	tickdown	7	caretup	"v"	triangle_down	"1"	tri_down
"None"	nothing	None	default	" "	nothing	""	nothing

Linestyle

linestyle	description
'-'	solid
'--'	dashed
'-.'	dashdot
':'	dotted
'None'	draw nothing
''	draw nothing
""	draw nothing

Example

```
ax=fig.add_subplot(111)
t = np.arange(0.0, 5.0, 0.2)
plt.plot( t, t**3,
          color='black',
          marker='x',
          linestyle=':')
plt.show()
```

Style for other plots

```
fig, ax = plt.subplots(1, 1)
ax.bar([1, 2, 3, 4], [10, 20, 15, 13],
       linestyle='--', #linestyle
       ec='r', #color
       lw=5) #linewidth
plt.show()
```

Simple syntax, but too implicit!

```
fig, ax = plt.subplots(1, 1)
t = np.arange(0., 5., 0.2)
# red dashes, blue squares and green triangles
plt.plot(t, t, 'r--', t, t**2, 'bs', t, t**3, 'g^-')
plt.show()
```

Property	Value Type
alpha	float
color or c	any matplotlib color
dash_capstyle	['butt', 'round', 'projecting']
dash_joinstyle	['miter', 'round', 'bevel']
dashes	sequence of on/off ink in points
drawstyle	['default' 'steps' 'steps-pre' 'steps-mid' 'steps-post']
linestyle or ls	['-' '--' '-' ':' 'None' '']
	and any drawstyle in combination with a linestyle, e.g. 'steps--'.
linewidth or lw	float value in points
marker	[0 1 2 3 4 5 6 7 'o' 'd' 'D' 'h' 'H' '' 'None' '' 'None' '8' 'p' ',' '+' 'x' '.' 's' '*' ' _ ' ' '1' '2' '3' '4' 'v' '<' '>' '^']
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markersize or ms	float
solid_capstyle	['butt', 'round', 'projecting']
solid_joinstyle	['miter', 'round', 'bevel']
visible	[True False]
zorder	any number

The 3rd dimension.

Contour plot

```
def f(x, y):  
    return np.sin(x) ** 10 + np.cos(10 + y * x) * np.cos(x)
```

```
x = np.linspace(0, 5, 50)
```

```
y = np.linspace(0, 5, 40)
```

```
X, Y = np.meshgrid(x, y)
```

```
Z = f(X, Y)
```

```
plt.contour(X, Y, Z, colors='black');
```

Colorful contour

```
def f(x, y):  
    return np.sin(x) ** 10 + np.cos(10 + y * x) * np.cos(x)
```

```
x = np.linspace(0, 5, 50)
```

```
y = np.linspace(0, 5, 40)
```

```
X, Y = np.meshgrid(x, y)
```

```
Z = f(X, Y)
```

```
plt.contourf(X, Y, Z, cmap='RdGy');
```

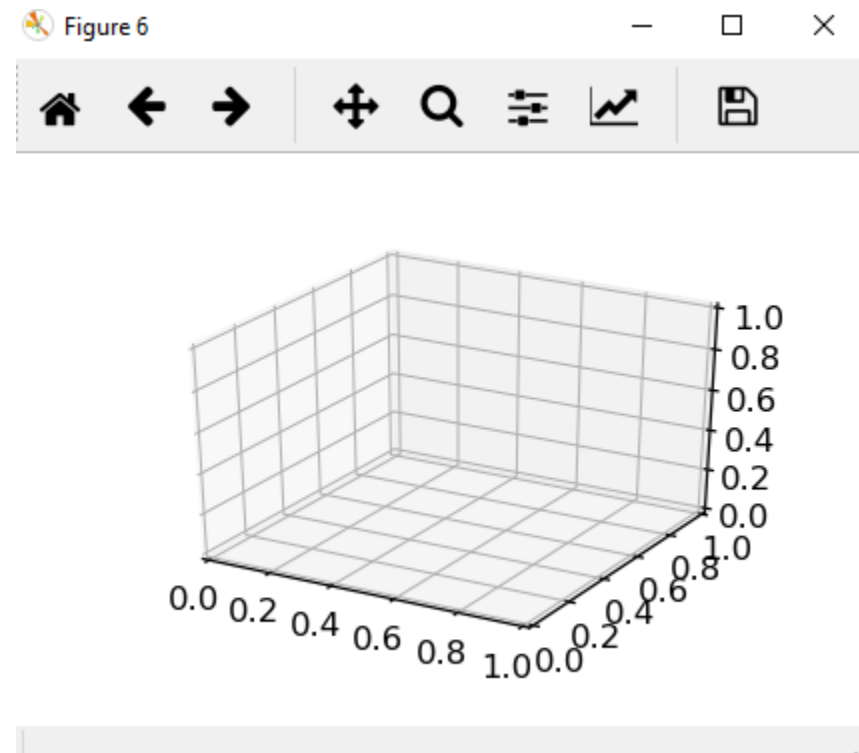

```
plt.colorbar()
```

```
plt.tight_layout()
```

3D plotting

```
fig = plt.figure()  
ax = fig.gca(projection="3d")  
plt.show()
```

```
plt.close("all")
def f(x, y):
    return np.sin(np.sqrt(x ** 2 + y ** 2))
```

```
x = np.linspace(-6, 6, 30)
y = np.linspace(-6, 6, 30)
```

```
X, Y = np.meshgrid(x, y)
Z = f(X, Y)
```

```
fig = plt.figure()
ax = fig.gca(projection="3d")
ax.plot_surface(X, Y, Z,
               cmap='coolwarm')
```

```
ax.set_title('surface');
ax.set_xlabel('x')
ax.set_ylabel('y')
ax.set_zlabel('z');
plt.tight_layout()
plt.show()
```

Matplotlib backends

```
import matplotlib
matplotlib.get_backend()
matplotlib.use('Qt5Agg')
```

<https://matplotlib.org/tutorials/introductory/usage.html>

Backend	Description
Qt5Agg	Agg rendering in a Qt5 canvas (requires PyQt5). This backend can be activated in IPython with <code>%matplotlib qt5</code> .
ipympl	Agg rendering embedded in a Jupyter widget. (requires ipympl). This backend can be enabled in a Jupyter notebook with <code>%matplotlib ipympl</code> .
GTK3Agg	Agg rendering to a GTK 3.x canvas (requires PyGObject , and pycairo or cairocffi). This backend can be activated in IPython with <code>%matplotlib gtk3</code> .
macosx	Agg rendering into a Cocoa canvas in OSX. This backend can be activated in IPython with <code>%matplotlib osx</code> .
TkAgg	Agg rendering to a Tk canvas (requires TkInter). This backend can be activated in IPython with <code>%matplotlib tk</code> .
nbAgg	Embed an interactive figure in a Jupyter classic notebook. This backend can be enabled in Jupyter notebooks via <code>%matplotlib notebook</code> .
WebAgg	On <code>show()</code> will start a tornado server with an interactive figure.
GTK3Cairo	Cairo rendering to a GTK 3.x canvas (requires PyGObject , and pycairo or cairocffi).
Qt4Agg	Agg rendering to a Qt4 canvas (requires PyQt4 or pyside). This backend can be activated in IPython with <code>%matplotlib qt4</code> .
WXAgg	Agg rendering to a wxWidgets canvas (requires wxPython 4). This backend can be activated in IPython with <code>%matplotlib wx</code> .

Pandas

Pandas

(Python **and** Data **Analysis**)

https://pandas.pydata.org/pandas-docs/stable/getting_started/10min.html#min

A fast and efficient **DataFrame** object.

reading and writing data

Flexible **reshaping, slicing, fancy indexing**

Python with *pandas* is in use in a wide variety of **academic and commercial** domains, including Finance, Neuroscience, Economics, Statistics, Advertising, Web Analytics, and more.

```
import pandas as pd
```

Series

One dimensional fancy indexed arrays:

```
fruits = ['apples', 'oranges', 'cherries',  
'pears']
```

```
quantities = [20, 33, 52, 10]
```

```
S = pd.Series(quantities, index=fruits)
```

S

```
apples    20  
oranges   33  
cherries  52  
pears     10  
dtype: int64
```

Add two series objects

```
fruits = ['apples', 'oranges', 'cherries',  
'pears']  
  
S = pd.Series([20, 33, 52, 10], index=fruits)  
S2 = pd.Series([17, 13, 31, 32], index=fruits)  
  
print(S + S2)  
  
print("sum of S: ", sum(S))
```

```
apples      37  
oranges     46  
cherries    83  
pears       42  
dtype: int64  
sum of S:   115
```

Accessing elements

```
print(S['apples'])
```

20

```
print(S[['apples', 'oranges', 'cherries']])
```

```
apples    20  
oranges   33  
cherries  52  
dtype: int64
```

Operations

```
import numpy as np
```

```
S.apply(np.sin)
```

```
apples    30
oranges   43
cherries  52
pears     20
dtype: int64
```

```
S.apply(lambda x: x if x > 50 else x+10 )
```

```
S[S>30] #boolean indexing
```

```
oranges    33
cherries   52
dtype: int64
```

.CSV

A screenshot of a Notepad window titled 'cityframe.csv - Notepad'. The window displays the contents of the cityframe.csv file, which is a CSV file containing city data. The data is shown as a list of cities with their names, populations, and countries.

	name	population	country
0	London	8615246	England
1	Berlin	3562166	Germany
2	Madrid	3165235	Spain
3	Rome	2874038	Italy
4	Paris	2273305	France
5	Vienna	1805681	Austria
6	Bucharest	1803425	Romania
7	Hamburg	1760433	Germany
8	Budapest	1754000	Hungary
9	Warsaw	1740119	Poland
10	Barcelona	1602386	Spain
11	Munich	1493900	Germany
12	Milan	1350680	Italy

DataFrame

```
city_frame=pd.read_csv("cityframe.csv")
```

```
print(city_frame)
```

```
print(type(city_frame))
```

```
city_frame.head()
```

	name	population	country

Hungary	Budapest	1754000
Poland	Warsaw	1740119
Spain	Barcelona	1602386
Germany	Munich	1493900
Italy	Milan	1350680

Accessing rows and cols

```
#access coln
```

```
city_frame['population']
```

```
type(city_frame['population']) #series is 1D dataframe
```

```
#for multiple indicies, pass a list:
```

```
city_frame[['population','name']]
```

```
type(city_frame[['population','name']])
```

country	population	name
England	8615246	London
Germany	3562166	Berlin
Spain	3165235	Madrid
Italy	2874038	Rome

```
#access row
```

```
city_frame.loc["Germany"]
```

```
type(city_frame.loc["Germany"])
```

```
#for multiple indicies, pass a list:
```

```
print(city_frame.loc[["Germany", 'France']])
```

country	name	population
Germany	Berlin	3562166
Germany	Hamburg	1760433
Germany	Munich	1493900
France	Paris	2273305

Q: How to access
a single element
of a dataframe?

Adding new coln

```
area = [1572, 891.85, 605.77, 1285,  
        105.4, 414.6, 228, 755,  
        525.2, 517, 101.9, 310.4,  
        181.8]
```

```
# area could have been designed as a list,  
# a Series, an array or a scalar
```

```
city_frame["area"] = area  
city_frame.head()
```

	name	population	area
country			
England	London	8615246	1572.00
Germany	Berlin	3562166	891.85
Spain	Madrid	3165235	605.77
Italy	Rome	2874038	1285.00
France	Paris	2273305	105.40

World population

LIVE EXAMPLE

Hierarchical indices

```
shop1 = {"foo":{2010:23, 2011:25}, "bar":{2010:13,  
2011:29}}
```

```
shop2 = {"foo":{2010:223, 2011:225}, "bar":{2010:213,  
2011:229}}
```

```
shop1 = pd.DataFrame(shop1)
```

```
shop2 = pd.DataFrame(shop2)
```

```
both_shops = shop1 + shop2
```

```
shops = pd.concat([shop1, shop2], keys=["one", "two"])
```

```
shops.swaplevel()
```

```
shops.swaplevel().sort_index()
```

World population

BACK TO EXAMPLE

Useful methods

```
df.T
```

```
df.describe()
```

```
df.to_numpy()
```

```
df.tail(3)
```

```
df.sort_values(by='B')
```

```
df[df > 0]
```

```
df.apply(np.cumsum)
```

Data Wrangling with pandas Cheat Sheet

<http://pandas.pydata.org>

Syntax – Creating DataFrames

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

```
df = pd.DataFrame(
    {"a": [4, 5, 6],
     "b": [7, 8, 9],
     "c": [10, 11, 12]},
    index = [1, 2, 3])
```

Specify values for each column.

```
df = pd.DataFrame(
    [[4, 7, 10],
     [5, 8, 11],
     [6, 9, 12]],
    index=[1, 2, 3],
    columns=['a', 'b', 'c'])
```

Specify values for each row.

	a	b	c
n			
d	1	4	7
	2	5	8
e	2	6	9

```
df = pd.DataFrame(
    {"a": [4, 5, 6],
     "b": [7, 8, 9],
     "c": [10, 11, 12]},
    index = pd.MultiIndex.from_tuples(
        [('d', 1), ('d', 2), ('e', 2)],
        names=['n', 'v']))
```

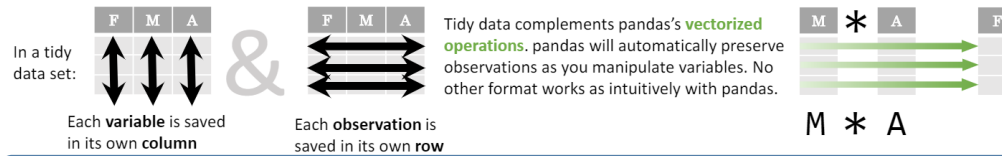

Create DataFrame with a MultiIndex

Method Chaining

Most pandas methods return a DataFrame so that another pandas method can be applied to the result. This improves readability of code.

```
df = (pd.melt(df)
      .rename(columns={
          'variable': 'var',
          'value': 'val'})
      .query('val >= 200'))
```

Tidy Data – A foundation for wrangling in pandas

Reshaping Data – Change the layout of a data set

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

pd.melt(df)
Gather columns into rows.

	var	val
1	a	4
1	b	7
1	c	10
2	a	5
2	b	8
2	c	11
3	a	6
3	b	9
3	c	12

df.pivot(columns='var', values='val')
Spread rows into columns.

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

pd.concat([df1, df2])
Append rows of DataFrames

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

pd.concat([df1, df2], axis=1)
Append columns of DataFrames

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

df.sort_values('mpg')
Order rows by values of a column (low to high).

df.sort_values('mpg', ascending=False)
Order rows by values of a column (high to low).

df.rename(columns = {'y': 'year'})
Rename the columns of a DataFrame

df.sort_index()
Sort the index of a DataFrame

df.reset_index()
Reset index of DataFrame to row numbers, moving index to columns.

df.drop(columns=['Length', 'Height'])
Drop columns from DataFrame

Subset Observations (Rows)

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

df[df.Length > 7]
Extract rows that meet logical criteria.

df.drop_duplicates()
Remove duplicate rows (only considers columns).

df.head(n)
Select first n rows.

df.tail(n)
Select last n rows.

df.sample(frac=0.5)
Randomly select fraction of rows.

df.sample(n=10)
Randomly select n rows.

df.iloc[10:20]
Select rows by position.

df.nlargest(n, 'value')
Select and order top n entries.

df.nsmallest(n, 'value')
Select and order bottom n entries.

Subset Variables (Columns)

	a	b	c
1	4	7	10
2	5	8	11
3	6	9	12

df[['width', 'length', 'species']]
Select multiple columns with specific names.

df['width'] or **df.width**
Select single column with specific name.

df.filter(regex='regex')
Select columns whose name matches regular expression regex.

regex (Regular Expressions) Examples

regex	Examples
'\.'	Matches strings containing a period '.'
'Length\$'	Matches strings ending with word 'Length'
'^Sepal'	Matches strings beginning with the word 'Sepal'
'^x[1-5]\$'	Matches strings beginning with 'x' and ending with 1,2,3,4,5
'^(?!Species\$).*\$'	Matches strings except the string 'Species'

df.loc[:, 'x2': 'x4']
Select all columns between x2 and x4 (inclusive).

df.iloc[:, [1, 2, 5]]
Select columns in positions 1, 2 and 5 (first column is 0).

df.loc[df['a'] > 10, ['a', 'c']]
Select rows meeting logical condition, and only the specific columns.

<http://pandas.pydata.org/> This cheat sheet inspired by Rstudio Data Wrangling Cheatsheet (<https://www.rstudio.com/wp-content/uploads/2015/02/data-wrangling-cheatsheet.pdf>) Written by Irv Lustin, Princeton Consultants

Summarize Data

df['w'].value_counts()
Count number of rows with each unique value of variable

len(df)
of rows in DataFrame.

df['w'].nunique()
of distinct values in a column.

df.describe()
Basic descriptive statistics for each column (or GroupBy)

pandas provides a large set of **summary functions** that operate on different kinds of pandas objects (DataFrame columns, Series, GroupBy, Expanding and Rolling (see below)) and produce single values for each of the groups. When applied to a DataFrame, the result is returned as a pandas Series for each column. Examples:

sum() Sum values of each object.	min() Minimum value in each object.
count() Count non-NA/null values of each object.	max() Maximum value in each object.
median() Median value of each object.	mean() Mean value of each object.
quantile([0.25, 0.75]) Quantiles of each object.	var() Variance of each object.
apply(function) Apply function to each object.	std() Standard deviation of each object.

Group Data

df.groupby(by="col")
Return a GroupBy object, grouped by values in column named "col".

df.groupby(level="ind")
Return a GroupBy object, grouped by values in index level named "ind".

All of the summary functions listed above can be applied to a group. Additional GroupBy functions:

size()
Size of each group.

agg(function)
Aggregate group using function.

Windows

df.expanding()
Return an Expanding object allowing summary functions to be applied cumulatively.

df.rolling(n)
Return a Rolling object allowing summary functions to be applied to windows of length n.

Handling Missing Data

df.dropna()
Drop rows with any column having NA/null data.

df.fillna(value)
Replace all NA/null data with value.

Make New Columns

df.assign(Area=lambda df: df.Length*df.Height)
Compute and append one or more new columns.

df['Volume'] = df.Length*df.Height*df.Depth
Add single column.

pd.qcut(df.col, n, labels=False)
Bin column into n buckets.

pandas provides a large set of **vector functions** that operate on all columns of a DataFrame or a single selected column (a pandas Series). These functions produce vectors of values for each of the columns, or a single Series for the individual Series. Examples:

max(axis=1) Element-wise max.	min(axis=1) Element-wise min.
clip(lower=-10, upper=10) Trim values at input thresholds	abs() Absolute value.

The examples below can also be applied to groups. In this case, the function is applied on a per-group basis, and the returned vectors are of the length of the original DataFrame.

shift(1) Copy with values shifted by 1.	shift(-1) Copy with values lagged by 1.
rank(method='dense') Ranks with no gaps.	cumsum() Cumulative sum.
rank(method='min') Ranks. Ties get min rank.	cummax() Cumulative max.
rank(pct=True) Ranks rescaled to interval [0, 1].	cummin() Cumulative min.
rank(method='first') Ranks. Ties go to first value.	cumprod() Cumulative product.

Plotting

df.plot.hist()
Histogram for each column

df.plot.scatter(x='w', y='h')
Scatter chart using pairs of points

Combine Data Sets

adf		bdf	
x1	x2	x1	x3
A	1	A	T
B	2	B	F
C	3	D	T

+

=

Standard Joins

x1	x2	x3
A	1	T
B	2	F
C	3	NaN

pd.merge(adf, bdf, how='left', on='x1')
Join matching rows from bdf to adf.

x1	x2	x3
A	1.0	T
B	2.0	F
D	NaN	T

pd.merge(adf, bdf, how='right', on='x1')
Join matching rows from adf to bdf.

x1	x2	x3
A	1	T
B	2	F

pd.merge(adf, bdf, how='inner', on='x1')
Join data. Retain only rows in both sets.

x1	x2	x3
A	1	T
B	2	F
C	3	NaN
D	NaN	T

pd.merge(adf, bdf, how='outer', on='x1')
Join data. Retain all values, all rows.

Filtering Joins

x1	x2
A	1
B	2

adf[adf.x1.isin(bdf.x1)]
All rows in adf that have a match in bdf.

x1	x2
C	3

adf[~adf.x1.isin(bdf.x1)]
All rows in adf that do not have a match in bdf.

ydf		zdf	
x1	x2	x1	x2
A	1	B	2
B	2	C	3
C	3	D	4

+

=

Set-like Operations

x1	x2
B	2
C	3

pd.merge(ydf, zdf)
Rows that appear in both ydf and zdf (Intersection).

x1	x2
A	1
B	2
C	3
D	4

pd.merge(ydf, zdf, how='outer')
Rows that appear in either or both ydf and zdf (Union).

x1	x2
A	1

pd.merge(ydf, zdf, how='outer', indicator=True)
.query('_merge == "left_only"')
.drop(columns=['_merge'])
Rows that appear in ydf but not zdf (Setdiff).

Pandas vs excel!

Analyze large datasets:

- Excel is sluggish at 10000 rows

More high level functions.

More file formats: CSV, HTML, SQL.

Automated procedures.

Co-existence!
